

AMENDMENTS TO THE CLAIMS

1-39. (Canceled)

40. (Currently Amended) A method for determining medication efficacy, comprising:

- a) providing;
 - i) a patient exhibiting a first electroencephalogram; and
 - ii) a medication; and,
- b) converting said first electroencephalogram to at least one first multivariate outcome measurement wherein said first outcome measurement comprises a plurality of first univariate Z scores, wherein said first multivariate outcome measurement is derived from a frequency band selected from the group consisting of delta, theta, alpha, and beta;
- c) administering said medication to said patient;
- d) obtaining a second electroencephalogram from said patient and converting said second electroencephalogram to at least one second multivariable outcome measurement wherein said second outcome measurement comprises a plurality of second univariate Z scores, wherein said second multivariate outcome measurement is derived from a frequency band selected from the group consisting of delta, theta, alpha, and beta; and
- e) comparing said first multivariate outcome measurement with said second multivariate outcome measurement wherein ~~a difference is identified under conditions such that said difference~~ a differential change between said first and second measurement determines said medication efficacy.

41. (Previously Presented) A method according to claim 40, wherein said comparing comprising using a reference database.

42. (Previously Presented) A method according to claim 40, wherein said difference between said first multivariate outcome measurement and second

follow-up multivariate outcome measurement is proportional to the efficacy of said medication.

43-49. (Canceled)

50. (Previously Presented) The method of Claim 40, wherein said delta frequency band comprises a first set of univariate measurements selected from the group consisting of absolute power, relative power, coherence, and symmetry.

51. (Previously Presented) The method of Claim 40, wherein said theta frequency band comprises a second set of univariate measurements selected from the group consisting of absolute power, relative power, coherence, and symmetry.

52. (Previously Presented) The method of Claim 40, wherein said alpha frequency band comprises a third set of univariate measurements selected from the group consisting of absolute power, relative power, coherence, and symmetry.

53. (Previously Presented) The method of Claim 40, wherein said beta frequency band comprises a fourth set of univariate measurements selected from the group consisting of absolute power, relative power, coherence, and symmetry.

54. (Currently Amended) A method for determining medication efficacy, comprising:

- a) providing;
 - i) a patient exhibiting a first electroencephalogram; and
 - ii) a medication; and,
- b) converting said first electroencephalogram to at least one first multivariate outcome measurement wherein said first outcome measurement comprises a plurality of first univariate Z scores, wherein said first multivariate outcome measurement is derived from a frequency band selected from the group consisting of

- ranging from approximately 0.5-3.5 Hertz, ranging from approximately 3.5-7.5 Hertz, ranging from approximately 7.5-12.5 Hertz, and ranging from approximately 12.5-35 Hertz;
- c) administering said medication to said patient;
 - d) obtaining a second electroencephalogram from said patient and converting said second electroencephalogram to at least one second multivariable outcome measurement wherein said second outcome measurement comprises a plurality of second univariate Z scores, wherein said second multivariate outcome measurement is derived from a frequency band selected from the group consisting of ranging from approximately 0.5-3.5 Hertz, ranging from approximately 3.5-7.5 Hertz, ranging from approximately 7.5-12.5 Hertz, and ranging from approximately 12.5-35 Hertz; and
 - e) comparing said first multivariate outcome measurement with said second multivariate outcome measurement wherein a ~~difference~~ differential change between said first and second measurement is identified under conditions such that said difference determines said medication ~~drug~~ efficacy.

55. (Previously Presented) A method according to claim 54, wherein said comparing comprising using a reference database.

56. (Previously Presented) A method according to claim 54, wherein said difference between said first multivariate outcome measurement and second follow-up multivariate outcome measurement is proportional to the efficacy of said medication.

57. (Withdrawn) A method for determining drug efficacy, comprising:

- a) providing;
 - i) a patient exhibiting first electroencephalogram;
 - ii) a drug;
 - iii) a first symptomatic behavioral assessment;
- and

- b) converting said first electroencephalogram to at least one first multivariate outcome measurement, wherein said first multivariate outcome measurement is derived from a frequency band selected from the group consisting of delta, theta, alpha, and beta;
- c) administering said drug to said patient;
- d) obtaining a second clinical assessment of said patient; and
- e) comparing said first symptomatic behavioral assessment with said second symptomatic behavioral assessment wherein an improvement is identified.

58. (Withdrawn) The method of Claim 57, further comprising, identifying said at least one multivariate outcome measurement in at least a second patient.

59. (Withdrawn) The method of Claim 57, wherein said drug is desiprimine.

60. (Withdrawn) The method of Claim 57, wherein said multivariate outcome measurement is relative power monopolar posterior alpha.
